# Resources

**MATH 107: Introduction to Linear Algebra**

Daily reading assignments are listed with each meeting on Lectures.

# Textbook

The main text is Stephen Boyd and Lieven Vandenberghe, *Introduction to Applied Linear Algebra: Vectors, Matrices, and Least Squares* (VMLS). The book is free to read and download from the authors.

A few meetings use Gilbert Strang, *Introduction to Linear Algebra*, selected sections (especially §3.5, 6.1, and 7.1). Those days are marked on Lectures. You do not need to buy Strang unless you want a second reference.

Lab and programming practice also draws on Jeffrey Lachniet, *Introduction to GNU Octave* (3rd ed., 2020). That text is licensed CC BY-SA 4.0. Direct adaptations of Lachniet keep attribution and share-alike terms. Python versions of those prompts use the same mathematics; only syntax and scaffolding change.

# Software

We will use **Octave** or **Python**. Either is fine; pick one and stay with it.

- GNU Octave (MATLAB-like; the GUI is enough for this course)
- Python with NumPy (and Matplotlib for plots). SymPy is optional for exact row reduction later in the term.

Lab 0 assumes no prior coding. Bring a laptop to lab days, or use a campus lab machine.

# Campus support

- Cal Poly Humboldt
- Library
- Student Disability Resource Center
- Counseling and Psychological Services

Tutoring and drop-in help: check the current campus learning-center listings once the term site is posted, or ask in office hours.

# This website

Lecture outlines, labs, and assessments live here. Canvas is for submission, graded quizzes, grades, and feedback.
